AgriRent AI — demo & test guide

Farm-equipment rental for Indian farmers: find a machine for a job, book it, and prove what condition it was in — so neither side can lie about damage.

Sign in with these two accounts

Role	Email	Password	What they do on stage
Owner	abdullacyclewala@gmail.com	12345678	Lists machines, accepts the booking, records handover, files a claim
Renter	menhdi@gmail.com	12345678	Searches, books, countersigns, records the return, answers the claim

Already set up for you
Booking **#53** is prepared and ready to walk through: **menhdi@gmail.com** renting **Mahindra 575 DI Tractor** (Abdulla) — status Confirmed, no condition report filed yet, so the handover you shoot on stage is the first real one. Abdulla is in owner mode; Mehndi is in renter mode. Both profiles already have a saved location, so the marketplace shows distances without a permission prompt.

What	Where
The app	https://agrirent-ai.vercel.app
The prepared booking	https://agrirent-ai.vercel.app/booking/53
The new marketplace tab	https://agrirent-ai.vercel.app/marketplace
Backend health / AI status	https://agrirent-ai-backend.onrender.com/verification/config

Five minutes before you start

- Run the readiness check (read-only, tells you the truth): `SUPABASE_URL=… ANON_KEY=… node scripts/check-demo-ready.mjs`
- Open the app once and log in as **both** accounts in two browser profiles — the free backend sleeps, and the first request after a nap takes 30–60 seconds. Waking it beforehand is the single biggest demo risk.
- Have the machine (or any object) ready to photograph, and allow the camera when the browser asks.

The demo — 10 minutes, two people, one story

Part 1 · The app a farmer actually uses (4 min)

#	Do this	Say this / what to notice
1	Sign in as **menhdi@gmail.com**. Land on the Dashboard.	“Everything starts from the farmer's side: what work do you have?”
2	Tap **Find Equipment** → type a job in plain language, e.g. “I need to plough 3 acres of wheat in Panvel next week”.	The AI parser fills crop, operation, land size, place and date by itself — the farmer only checks it.
3	Walk the review step and get results.	A ranking model orders the matches and explains why each one fits. Hard rules (crop, operation, distance) filter first.
4	Open **Marketplace** (new tab). Filter by type, price, distance; search “Panvel”.	The other half of the product: browse what's nearby without answering a questionnaire. Distance comes from PostGIS and respects each owner's own service radius.
5	Open a machine → book it for two days.	Booking is a request; the owner accepts. Availability and double-booking are checked server-side.

#	Do this	Say this / what to notice
6	Switch to the **Abdulla** window, open the booking, press **Accept**.	Realtime: the renter's page updates without a refresh. (Push notifications can be shown too if enabled.)

Part 2 · The part that makes it trustworthy (6 min)

This is the Phase 7 feature: a signed condition report at handover and at return, so “it was already damaged” stops being an argument.

#	Do this	What to point at
7	As **Abdulla**, open booking #53 and press **Record condition before handover**.	One card, one button — no menu. The deposit is shown as a single number.
8	Shoot the four guided photos (whole machine ×2, hour meter, tyres/implement).	Each photo is stamped inside the pixels with the report code, date, time and GPS — and fingerprinted twice. Turn the phone: it is four taps.
9	Note any damage that is already there (chips, one tap), then submit.	This is what protects the renter from being blamed for old damage — the machine gets a file, carried into every future rental.
10	Read the **“What the app sees in these photos”** panel and sign.	The AI reads the photos and reports damage with a confidence score. It never decides: AI flags, a person decides. The signature locks the record — nobody, including the owner, can change it afterwards.
11	Switch to **Mehndi**: open the report, press **This is correct**.	One tap. Two separate attestations are now on record — the renter is not signing the owner's word, they are confirming what they saw.
12	As Mehndi, record the **return** condition the same way.	The return report is compared view-by-view against the handover photos, side by side.
13	Deliberate mistake (the best 40 seconds of the demo): use the gallery and re-submit the **handover photo** as the return.	The report flags “same image as an earlier photo” and drops to **Not verified**. That is what stops a machine being “inspected” from a desk.
14	As Abdulla, file a claim of **₹5,000** with no repair estimate, then attach a photographed bill.	The database itself refuses a large claim without an estimate — the rule lives in Postgres, not just in the screen.
15	As Mehndi, press **Dispute this**.	Nothing is deducted while a claim is disputed: the disputed amount is held, the rest is released. AI never moves money.
16	Log out, open **/verify/AR-XXXXXXXX** with the report code.	The close: anyone — a bank, an insurer, a court — can check the report is intact, without an account and without seeing anyone's photos.

Test it yourself — the short checklist

Each line is: what to do → what you should see. Anything else is a bug; tell me the report code and what happened.

Area	Do this	Expect
Accounts	Sign in as both accounts with 12345678	Both open; Abdulla sees owner tools, Mehndi sees the renter view
Marketplace	Open the Marketplace tab; change type/price/distance; search a village name	Cards filter live; distance shown in km; count line updates; “Clear filters” resets
Marketplace	Press “Show what's near me” and allow location	Distances refresh and are remembered on your profile
Handover	Booking #53 → Record condition before handover → 4 photos → submit	Photos upload with progress; no typing required

Area	Do this	Expect
Capture quality	Take one deliberately dark or blank photo	“Retake suggested” appears — it advises, it never blocks
Capture privacy	Deny the location permission on one photo	“No location — the rest still works”; the flow continues
AI reading	Look at the AI panel after uploading	Summary + damage items with %; an hour-meter value if the digits are legible
AI retry	If it says “AI reading off”, press Re-run the check	The reading appears using the photos already stored — nothing to retake
Signature	Sign with a finger, then reload the page	Signature persists; the report is locked and cannot be edited
Two parties	Counterparty view: press “This is correct”	One tap records their attestation; the report stops being marked “One-sided”
Return	Open the return report	“Before and after, view by view” sliders appear when a handover exists
Duplicate trap	Submit the handover photo again as a return photo	Flagged as the same image; verdict drops to Not verified
Claim rule	File ₹5,000 with no estimate attached	Refused — the estimate photo is required from ₹2,000 up
Deposit	Dispute a claim	₹0 deducted, disputed amount held; neither party can unilaterally take money
Verification	With/AR-XXXXXXXX logged out	“This report is intact”, with entries, signers and fingerprint. A wrong code says “not found”
Privacy	As a third account, open the report URL	Sees nothing — RLS keeps evidence to the two parties
Languages	Switch to हिंदी / मराठी on the report screen	Every screen follows the switch — headings, dates, statuses, buttons, error messages. The AI's own reading follows it too: press **Re-run the check** and the summary and damage notes come back in that language (its internal codes stay English on purpose). Hindi/Marathi copy is machine-drafted — worth a native-speaker read).

If something goes wrong on stage

Symptom	Do this
A page spins for 30–60 seconds on the first click	That is the free backend waking up. Say so — it is honest and it is fine. Keep clicking; the next request is instant.
“AI reading off — evidence still recorded”	Press **Re-run the check** in that panel. If it still fails, continue: the evidence, signatures and verification all work without any AI — that is by design, and worth saying out loud.
The marketplace looks empty	Widen the distance filter (50 → 100 km). An owner's own service radius also limits what appears — that is the rule, not a bug.
Camera does not open	Use **Use my gallery**. The flow accepts a gallery photo and notes that it carries no camera metadata — a real, explainable behaviour.
A photo is blurry / the retake prompt keeps appearing	Take it again with more light and both hands steady; the prompt is advice. You can also keep it — the report will carry a quality note rather than hide it.
Anything else	Note the report code (AR-XXXXXXXX) or booking number, take a screenshot, carry on. Every state is recoverable and nothing is lost.

Questions professors usually ask — the honest answers

- **“Can the AI be wrong?”** Yes, and it is built that way on purpose. The AI only flags; every flag is shown with its reason and a person decides. A wrong AI note costs a conversation, not a payment.
- **“What stops someone faking photos?”** No single check would. Five weak signals are combined instead: the exact-byte fingerprint, a perceptual image fingerprint (catches the same photo resized or re-compressed), GPS against the machine's registered location, the camera clock against the server's receipt time, and a watermark burned into the pixels. Faking all five is more work than telling the truth.
- **“Can the record be edited later?”** No. Evidence rows and the audit trail are append-only in the database (no update or delete policy exists), and each entry is chained to the previous one by a SHA-256 hash computed inside Postgres. The public page recomputes that chain — so tampering is detectable, not just forbidden.
- **“Who can see the photos?”** Only the two parties on that booking. The bucket is private, access is enforced by row-level security, and the public verification page shows no photos and no personal data.
- **“Does the AI decide who pays?”** Never. AI cannot set an amount, and while a claim is disputed nothing is deducted. Payment still happens between the two people; the app records the agreement and the policy version it was made under.
- **“What is not finished?”** Payment is still off-platform (deliberate — no payment gateway). There is no persistent offline queue yet: a failed upload retries in the page, but a reload while offline loses that capture. And the Hindi/Marathi copy for this feature is machine-drafted pending a native-speaker review.

Scope, stated plainly
Verified condition reports, the dispute and deposit flow, the public verification page and the marketplace are all live on the deployed app. The engineering is tested three ways: 39 logic assertions, 31 backend tests, 43 assertions run against the live database as real signed-in users, plus two live probes of the deployed AI path.
